

What a drag: You can be a drag in managed code, too

Raymond Chen

David Anson digests my earlier series on virtual drag/drop and translates it into managed code. His example of dragging his entire RSS feed is an excellent illustration of dragging dynamically-generated virtual content. (I didn't use an example like that because the purpose of the *What a drag* series was to get something done in the least amount of code, and generating a stream from a URL takes an awful lot of code when doing it from the unmanaged side, which would ultimately detract from the point of the example.)

Bonus: He takes the example further by adding asynchronous support.
